NAME
 tccdstart − tccd bootstrap program for Windows NT systems

SYNOPSIS
 tccdstart [−**e** *name=value*] [−**l** *logfile*] [−**p** *port*]

DESCRIPTION
 tccdstart is used to start instances of **tccd** on demand when Distributed TETware is installed on a Windows NT system.

 tccdstart listens for service requests at the port indicated in the **tcc** service specification. When a connection request is received, **tccdstart** allocates an epherimal port for the connection and spawns an instance of **tccd**, passing the connected port to the new process. The **PATH** environment variable is used to locate **tccd** so it is necessary to include **$TET_ROOT/bin** in this variable when **tccdstart** is to be invoked.

 tccdstart does not run in the background. It should be invoked in its own console window.

 The following options are understood:

 −**e** *name=value*
 −**l** *logfile*
 These options and their arguments are passed to each invocation of **tccd**. See the **tccd**(1) manual page for details.

 −**p** *port*   Listen for service requests on the named *port* instead of the one indicated in the **tcc** service specification.
